

IN THE CLAIM:

1- 7 (Canceled)

8. (Currently Amended) A ring part, comprising:

a first partial ring with a first partial ring inner side and a first partial ring outer side and
a first end with a first partial ring non-flexible inner side joining structure at the inner side and
a second end with a first partial ring non-flexible outer side joining structure at the outer side,
5 said first partial ring inner side joining structure being substantially the same in shape as said
second partial ring outer side joining structure;

a second partial ring with a second partial ring inner side and a second partial ring outer
side and a second partial ring first end with a second partial ring non-flexible inner side joining
structure at the second partial ring inner side and a second partial ring second end with a
10 second partial ring non-flexible outer side joining structure at the second partial ring outer side,
said first partial ring inner side joining structure being substantially the same in shape as said
second partial ring outer side joining structure and said first partial ring being substantially
identical to said second partial ring, wherein each said joining structure has a back-engaging
surface of a shape that is inclined with respect to the radial direction of the ring part, wherein
15 said shape that is inclined extends from an inner side concave surface, in the vicinity of a hook
shaped portion and is joined to a convex end surface on the respective partial ring.

9. (Previously Presented) A ring part according to claim 1, wherein each said joining

structure has a shape of a hook for engaging behind another said joining structure.

10. (Previously Presented) A ring part according to claim 9, wherein each said joining structure has a shape that is substantially point symmetrical in construction.

11. (Canceled)

12. (Canceled)

13. (Previously Presented) A ring part according to claim 8, wherein each said joining structure of one partial ring is frictionally retained in another said joining structure of another said partial ring.

14. (Currently Amended) A ring part construction, comprising:

a first partial ring with a first partial ring inner side and a first partial ring outer side and a first end with a convex arcuate end wall portion joined via an angled surface to a concave surface to form a first partial ring non-flexible inner side joining structure at the inner side and a second end with a convex arcuate end wall portion joined via an angled surface to a concave surface to form a first partial ring non-flexible outer side joining structure at the outer side, ~~said first partial ring inner side joining structure being substantially the same in shape as said second partial ring outer side joining structure;~~

a second partial ring with a second partial ring inner side and a second partial ring outer side and a second partial ring first end with a convex arcuate end wall portion joined via an angled surface to concave surface to form a second partial ring non-flexible inner side joining structure at the second partial ring inner side and a second partial ring second end with a convex arcuate end wall portion joined via an angled surface to concave surface to form a second partial ring non-flexible outer side joining structure at the second partial ring outer side, said first partial ring inner side joining structure being substantially the same in shape as said second partial ring inner side joining structure and said second partial ring outer side joining structure being substantially the same in shape as said first partial ring outer side joining structure and said first partial ring being substantially identical to said second partial ring;

a multi-piece functional part, said first and second partial rings being engaged together with said first partial ring non-flexible inner side joining structure frictionally engaged with said second partial ring non-flexible outer side joining structure and said first partial ring non-flexible outer side joining structure frictionally engaged with said second partial ring non-flexible outer side joining structure, to radially hold together said functional part.

15. (New) A ring part construction according to claim 14, wherein each inner side joining structure has an outer side planar end face adjacent to said convex arcuate end wall portion and each inner side joining structure has an inner side planar end face adjacent to said concave surface, said outer side planar end face engaging said inner side planar end face with said first and second partial rings engaged together.

16. (New) A ring part construction according to claim 15, wherein opposite said outer side planar end face said concave surface joins said inner side at a point and opposite said outer side planar end face said convex arcuate end wall portion smoothly joins said outer side.

17. (New) A ring part construction, comprising:

a first partial ring with a first partial ring inner side and a first partial ring outer side and a first end with a rigid hook part having a convex arcuate end wall portion joined via an angled surface to a concave surface of a receiving recess, said hook and recess forming a first partial ring non-flexible inner side joining structure with said recess open at the inner side and a second end with a rigid hook part having a convex arcuate end wall portion joined via an angled surface to a concave surface of a receiving recess, said second end hook and recess forming a first partial ring non-flexible outer side joining structure with said second end recess open at the outer side;

a second partial ring with a second partial ring inner side and a second partial ring outer side and a second partial ring first end with a rigid second ring first hook part having a convex arcuate end wall portion joined via an angled surface to a concave surface of a second ring first receiving recess, said second ring first hook and first recess forming a second partial ring non-flexible inner side joining structure with said second ring first recess open at the second partial ring inner side and a second partial ring second end with a second ring second hook part having a convex arcuate end wall portion joined via an angled surface to concave surface of a second ring second recess to form a second partial ring non-flexible outer side joining

structure with said second ring second recess open at the second partial ring outer side, said first partial ring inner side joining structure being substantially the same in shape as said second partial ring inner side joining structure and said second partial ring outer side joining structure being substantially the same in shape as said first partial ring outer side joining structure and said first partial ring being identical to said second partial ring and being centrally symmetrical and rotationally symmetrical and said first ring outer side joining structure has a shape that is complementary to said second partial ring inner side joining structure said first ring inner side joining structure has a shape that is complementary to said second partial ring outer side joining structure whereby said first partial ring and said second partial ring are held in relative position by frictional force in the axial direction.

18. (New) A ring part construction according to claim 17, further comprising:

a multi-piece functional part, said first and second partial rings being engaged together with said first partial ring non-flexible inner side joining structure frictionally engaged with said second partial ring non-flexible outer side joining structure and said first partial ring non-flexible outer side joining structure frictionally engaged with said second partial ring non-flexible outer side joining structure, to radially hold together said functional part.

19. (New) A ring part construction according to claim 17, wherein each inner side joining structure has an outer side planar end face adjacent to said convex arcuate end wall portion and each inner side joining structure has an inner side planar end face adjacent to said

concave surface, said outer side planar end face engaging said inner side planar end face with said first and second partial rings engaged together.

20. (New) A ring part construction according to claim 17, wherein opposite said outer side planar end face said concave surface joins said inner side at a point and opposite said outer side planar end face said convex arcuate end wall portion smoothly joins said outer side.
